Phoenix, AZ

SUMMARY

Senior Full-Stack Engineer with 6+ years delivering customer-facing and internal SaaS products in fintech and healthcare. Experienced across frontend architecture, backend/API integration, performance optimization, testing strategy, and production release quality using React, Next.js, Node.js, .NET, SQL/PostgreSQL, and AI-assisted development workflows.

SKILLS

React, Next.js, TypeScript, JavaScript, React Native, Node.js, Go, REST APIs, API Integration, Microservices, C#, .NET Core, SQL, PostgreSQL, Performance Optimization, Jest, React Testing Library, Agile/Scrum, WCAG 2.1 AA, AI-Assisted Development

EXPERIENCE

American Express · Engineer II (Full-Stack) Sep 2022 - Present

- Owned and shipped key cardmember onboarding journeys, including activation flow, registration flow, and account servicing flows (remove card and add account user experiences).
- Built frontend + backend-integrated features for acquisition and servicing experiences, connecting UI states to secure REST APIs with robust validation and fallback handling.
- Implemented API orchestration patterns to combine profile, eligibility, and account service responses into cohesive user flows with lower failure rates.
- Applied performance optimizations (code splitting, lazy loading, smarter data-fetching strategies) to improve load speed and reduce client bundle impact.
- Contributed to AI-assisted feature development workflows (prompt-driven generation, iteration, and validation) to accelerate delivery and improve implementation quality.
- Wrote and maintained unit/integration coverage with Jest + React Testing Library for high-traffic releases and regression protection.
- Partnered with product, design, and platform stakeholders to translate compliance-heavy banking requirements into production-ready full-stack solutions.

Tango (Home Healthcare) · Mid-Level Full-Stack Engineer (Consultant) Aug 2021 - Sep 2022

- Built Oasis (Outcome and Assessment Information Set) workflows used in home healthcare operations to digitize critical patient-assessment documentation and reduce paper processes.
- Developed provider-facing portal features that enabled teams to track patient visits, review care notes, and monitor key visit data in one operational system.
- Implemented referral intake and submission experiences across provider workflows, improving throughput and supporting measurable revenue impact.
- Built and integrated REST APIs + microservices to connect patient records, scheduling context, and visit documentation with reliable data flow across systems.
- Improved role-based access and workflow routing so clinical and operational users could see the right patient information at the right step.
- Integrated third-party services and modernized core UI modules with TypeScript + React to improve maintainability, performance, and release velocity.
- Partnered with product and operations teams to translate home-health requirements into scalable, compliant software experiences.

B2Gnow · Software Engineer II Aug 2019 - Aug 2021

- Maintained and enhanced core application using C#, .NET, SQL, HTML/CSS; contributed to ~20% retention increase.
- Managed L1/L2 escalations and production support to maintain platform stability.
- Built custom SQL/SSRS reports to improve customer reporting and decision-making.
- Collaborated cross-functionally to ship customer-driven features.

PROJECTS

Whalor (whalor.app)

Tech: React Native (Expo), TypeScript, React (Web), Go (Backend), PostgreSQL, Clerk Auth

- Founded and built Whalor, a 0DTE options-alert product for iOS and web that detects same-day setups on SPY, QQQ, IWM, and selected liquid tickers in real time and delivers each one as a push alert with the exact contract, entry, and profit targets.
- Built the Go backend (REST APIs, background workers, PostgreSQL) that streams market data, scans for setups, publishes alerts, and grades every alert's outcome, publishing wins and losses to a public record.
- Shipped a React Native (Expo) iOS app with over-the-air updates and a React web app on one shared API, with Clerk authentication and user-scoped data access.
- Built a research and backtesting pipeline that tests strategies and exits on historical options quote data, using pre-registered rules and train/holdout splits before anything goes live.

QuickSign (quicksign.it)

Tech: Next.js, React, TypeScript, PostgreSQL, Prisma, Clerk, Stripe, Expo (Mobile)

- Built QuickSign as a web-first e-signature platform with a companion mobile application for on-the-go document actions.
- Implemented end-to-end document lifecycle workflows, including drafting, signature routing, signer status tracking, and completion handling.
- Integrated Clerk authentication, Stripe billing, and backend data models to support secure, auditable business workflows.
- Shipped AI-assisted document tooling to reduce manual drafting time and improve workflow speed.

LEENR (leenr.app)

Tech: React Native, Expo, TypeScript, PostgreSQL, Clerk, API Services

- Built LEENR as a mobile-first fitness application focused on consistency, adherence, and low-friction daily tracking.
- Implemented check-in, progress, and habit-loop features that help users track workouts and health behaviors over time.
- Designed secure auth and synced data experiences for personalized, reliable user sessions.
- Iterated onboarding and retention-focused UX flows to improve repeat engagement and long-term usage.
